

# Using Proportions

If a line parallel to a side of a triangle intersects the other two sides, then it divides those sides proportionally.

$$\frac{b}{a} = \frac{d}{c}$$

Find  $x$ .

$$\frac{32}{24} = \frac{40}{x}$$

$$32x = 24 \cdot 40$$

$$32x = 960$$

$$x = 30$$

$$\frac{8}{5} = \frac{10}{x}$$

$$\frac{8}{10} = \frac{5}{x}$$

$$8x = 50$$

$$x = \frac{50}{8} = \frac{25}{4}$$

Verify that  $\overline{TU}$  and  $\overline{RS}$  are parallel.

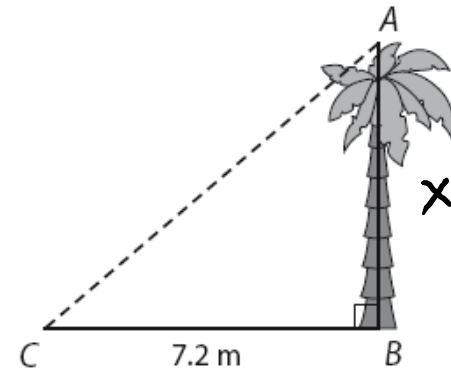

Indirect measurement involves using similarity and proportions to measure distances that can't be directly measured.

In order to find the height of a palm tree, you measure the tree's shadow and, at the same time of day, you measure the shadow cast by a meter stick that you hold at a right angle to the ground. Find the height  $h$  of the tree.

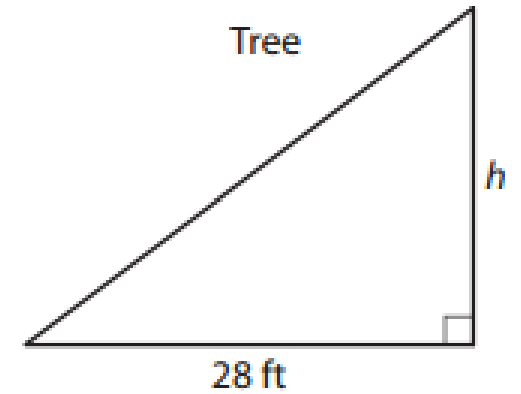

$$\frac{1}{x} \leftrightarrow \frac{1.6}{7.2}$$

$$1.6x = 7.2$$

$$x = \frac{7.2}{1.6} = 4.5 \text{ m}$$

Liam is 6 feet tall. To find the height of a tree, he measures his shadow and the tree's shadow. The measurements of the two shadows are shown. Find the height  $h$  of the tree.

To find the distance  $d$  across a stream, Levi located points as shown in the figure. Use the given information to find  $d$ .

$$\frac{d}{12} \sim \frac{12}{6}$$

$$6d = 144$$

$$d = 24$$
